Vectrino

Sample 3D velocity at up to 200 Hz for use in hydraulic models and laboratory flumes

The Vectrino is a high-resolution acoustic velocimeter used to measure 3D water velocity fluctuations within a very small sampling volume and at sample rates of up to 200 Hz. It can be applied in a variety of environments, from hydraulic labs – where it is regarded as standard equipment – to the ocean. It is ideal for near-boundary flow measurements or to capture any highly dynamic phenomena in a hydraulic tank.

Highlights

- Hydraulic models and flumes
- Inexpensive alternative to laser Doppler velocimeter
- 200 Hz maximum sampling rate

Applications

- 3D flow measurements in laboratory flumes
- Flow measurements near boundaries and in areas that are difficult to access
- Flow measurements in physical models in hydraulic laboratories
- Measurements of laboratory flume bottom changes as a function of time
